WEEK 2

This week we focused on html. The reading we had to do was "Why You Should Choose HTML5" and Lawson, Bruce. What I got or understood from this article is that Lawson basically goes on about how much better HTML5 is compared to the previous model which is HTML4. He listed some benefits that the newer version has and one that particularly stood out to me was the free to use benefit. Often times these programs or models are owned by companies that require you to pay for an extended use of their product. HTML 5 on the other hand is not owned by anyone, which means it is a free for all application.

This week we started learning about HTML and the basic HTML functions to get started on the website. I learned how to properly link VSC to GitHub, and how to broadcast our websites live. This week we also had an interesting lesson on wireframing and Layouts. I learned that it is essential for there to be an idea before the website is created, sort of like how an animator would scamp out their work before implementing it and turning it into an actual animation. I got to start on my design process which is more detailed if you press on the design link.

This week I focused more on wireframing than actually starting on my website, and I have properly reserved that for week 3.
